Comparism Table Of Enum,Interface And Abstract Class

	enum	abstract class	interface
Definition	Special Java type for defining a fixed set of constants.	Partially implemented class (can contain abstract + concrete methods).	Contract (blueprint) for classes with abstract methods (no implementation, until Java 8 default/static).
Inheritance	Extends java.lang.Enum(implicitly). Cannot extend another class.	Can extend one class (including abstract class).	Cannot extend classes, but can extend multiple other interfaces.
Implementation	Cannot be extended (enum is final). Can implement interfaces.	Must be subclassed and implemented.	Must be implemented by classes (or enums).
Constructors	private only	Can have constructors.	No constructors.
Methods	methods (concrete & abstract).	Both abstract & concrete methods allowed.	Abstract methods (until Java 8), default & static methods allowed.
Variables	Can have fields, methods, and constants.	instance variables, constants, methods.	constants (public static final).
Access Modifiers	Enum constants are public static final. Methods & fields can use modifiers.	Can use any access modifiers for fields/methods.	All methods are public abstract by default (unless default/static). Fields are public static final.
Instantiation	Cannot instantiate directly (only predefined constants).	Instantiate via subclass or anonymous class	Instantiate via **anonymous class** or **lambda** (if functional).
Multiple Inheritance	Not possible (but can implement multiple interfaces).	No (can only extend one class).	Yes (can extend multiple interfaces).
